Arizona State Office of Rural Health Webinar Series
Webinar Tips & Notes

- Mute your phone &/or computer microphone
- Time is reserved at the end for Q&A
- Please fill out the post-webinar survey
- Webinar is being recorded
- Recording will be posted on the SWTRC http://www.southwesttrc.org
AZ State Office of Rural Health
Monthly Webinar Series

Focused on providing technical assistance to rural stakeholders to disseminate research findings, policy updates, best-practices and other rural health issues to statewide rural partners and stakeholders throughout the state.
Get Covered • Stay Covered!

2015 ACA Open Enrollment
- Now until January 31, 2016 -

The University of Arizona has certified multilingual Navigators who can answer your questions and help you enroll in health insurance coverage. They are available for group presentations and to assist individuals in understanding and enrolling in the Marketplace.

All Navigator services are FREE of charge.

Contact: Martha Moore-Monroy: mmonroy@email.arizona.edu
Alyssa Padilla: alydilla@email.arizona.edu
Today’s presenters

Hong Chartrand, MPA
Program Manager for the Arizona Health Disparities Center, Arizona Department of Health Services

Stella Kiarie, MPH
State Refugee Health Coordinator for the Arizona Department of Health Services

Emily Oake, MHSM
Special Populations Coordinator for the Arizona Alliance for Community Health Centers

RJ Shannon
Program Manager for Native Health’s Integrated HIV Care Program
Health Disparities and Cultural Competence: A Local Approach
Health Disparities and Cultural Competence: A Local Response

Emily Oake, RJ Shannon
Stella Kiarie, Hong Chartrand
Objectives

- To learn about the Arizona Health Alliance for Language Access Rights (AHALAR)
- To provide an overview of the CLAS Standards
- To share resources and materials available that can assist with improving cultural and linguistic services within organizations
- To seek participants input on community profiles
Long-term goal: Create and sustain a welcoming environment that embraces Language Access Services (LAS) in Arizona

Three goals
- Improve cultural and linguistic competency and diversity of the community health center workforce
- Enhance consumers’ health service experience through awareness and availability of LAS.
- Enhance public and private entities’ capacity to effectively address LAS needs.

</table>
Social determinants of health: are the conditions in which people are born, grow, live, work and age. These circumstances are shaped by the distribution of money, power and resources at global, national and local levels.
Health Equity

- Health Equity, refers to the concept of fairness in health distribution, information, access to care, etc., such that all individuals have the opportunity to achieve their full potential through healthcare and disease prevention.
“...a concept that has a positive effect on patient care delivery by enabling providers to deliver services that are respectful of and responsive to the health beliefs, practices and cultural and linguistic needs of diverse patients” (National Institute of Health, 2014)

Alternative terms: cultural empathy, cultural humility, cultural capacities, cultural sensitivity, cultural awareness, cultural responsiveness...
The National Standards for Culturally and Linguistically Appropriate Services (CLAS) in Health and Health Care

The Standards are intended to advance health equity, improve quality, and help eliminate health care disparities by establishing a blueprint for health and health care organizations to:

- **Principle Standard:** Provide effective, equitable, understandable and respectful quality care and services that are responsive to diverse cultural health beliefs and practices, preferred languages, health literacy and other communication needs. (Standard 1)
Overview of CLAS Standards (cont.)

* Theme 1: Governance, Leadership, and Workforce (2-4)
* Theme 2: Communication and Language Assistance (5-8)
* Theme 3: Engagement, Continuous Improvement, and Accountability (9-15)
* 15 CLAS Standards: https://www.thinkculturalhealth.hhs.gov/pdfs/enhancednationalclasstandards.pdf
* Providing Language Assistance Services is Federal mandate for all recipients of Federal funds
Resources and Materials

I speak Arabic.
Please provide me with an interpreter.

Under Title VI of the 1964 Civil Rights Act, agencies that receive federal funds must provide the services of a professionally trained interpreter to clients who are not fluent in English. This law is meant to provide all people with equal access to public services. The interpreter’s services must be provided at no cost to the client.

For more information on Title VI, call the U.S. Department of Justice, Civil Rights Division at 1-888-848-5306 or U.S. Department of Health and Human Services, Region IX Office for Civil Rights: 1-415-437-8310.

We recommend that you note this person’s spoken language is his/her file.

Please point to your language. We will arrange a qualified interpreter at no cost to you.

Title VI of the Civil Rights Act of 1964 is a national law that protects persons from discrimination based on their race, color, or national origin in programs and activities that receive Federal financial assistance. Furthermore, the Federal civil rights law and other laws also prohibit discrimination in such programs and activities based on disability, age, sex and religion. Under this law, agencies that receive Federal funds must provide the services of a professionally trained interpreter to clients who are not fluent in English. This law is meant to provide all people with equal access to public services. The interpreter’s services must be provided at no cost to the client.

For more information on Title VI, call the U.S. Department of Justice, Civil Rights Division at 1-888-648-5005 or U.S. Department of Health and Human Services, Region IX Office for Civil Rights: 1-415-437-8310.

We recommend that you note your client’s spoken language in their file.

Content is adapted from the Maricopa Integrated Health System.
This is a project of the Arizona Health Disparities Center for Language Access Rights (AHLAR), a group of professionals devoted to seeking and maintaining a welcoming environment that embraces Language Access Services (LAS) in Arizona.
Required documents for AHCCCS and/or Sliding Fee Scale

- Photo Identification
- Social Security Card (if applicable)
- AHCCCS Denial Letter (if applying for Sliding Fee Scale)
- Lease Agreement or Utility Bill
- Birth Certificate
- Proof of Income (from last 30 days income)

Documento necesario para AHCCCS y/o Escala de Pagos

- Documentación de Identificación
- Certificado de Nacimiento
- Tarjeta de Seguro Social (si es aplicable)
- Carta de Negocios de AHCCCS o está aplicando para Casas de Pagos
- Renton Agreement
- Prueba de Ingresos (de los últimos 30 días)
Community Profile: Bhutanese

Language: Nepali, Dzongkha, English
Country of Origin: Bhutan
Places of Transition: Nepal, India

Dos and Don’ts

- Recognize that most Bhutanese refugees are Lhotospas, people originally from Nepal whose families settled in southern Bhutan several generations ago.
- Patients may have high expectations for healthcare providers. It is important to take some time to build rapport, treat the patient kindly, and be receptive to the patient’s concerns.
- Many Bhutanese have been exposed to English, but many still find it difficult to understand. Speak slowly and clearly, and be sure to keep them informed.
- Elders are highly respected in Lhotosampa culture. Decision-making is often first discussed with elders in the family, so be sure to keep them informed.
- For OB/GYN and reproductive health issues, always provide documentation of the patient’s sex, sexual orientation, and gender identity. The patient will feel more comfortable discussing these issues with a female provider.
- Emphasize the importance of preventive health measures, routine check-ups, and screenings.
- Encourage patients to communicate openly about their use of traditional medicine.
- Many Bhutanese are malnourished due to the limited nutritional diversity of food rations in the refugee camps. Give patients appropriate nutrition advice and supplements. Vitamin B12 supplements are particularly important for this population.

Health attitudes, beliefs and stigmas

Most Bhutanese refugees are Hindu (60%). Other religions include Buddhism (27%), Kirat (10%), and Christianity.

Hindus and Buddhists believe in reincarnation and often attribute illnesses to karma, actions performed in past lives.

Some Hindus and Kirat are vegetarian. Cows are considered sacred, and eating beef is prohibited among Hindus and Kirat.

Home remedies, traditional healers and shamans, spices and herbs, and astrological readings are often used as first-line treatment for illnesses.

Lhotospas tend to be reluctant about seeking medical care. Many prefer going to the ER for immediate care of serious health problems, rather than scheduling appointments for preventive care.

Physical and mental disabilities are considered shameful and are often kept hidden.

Pregnancy, birth, and death are viewed as spiritually impure periods that require the performance of rituals. In some families, women are expected to rest and not prepare food during their menstrual period.

Contraception and family planning are widely accepted and used, except by some more traditional individuals.

Many women have never encountered health screening procedures such as mammograms and pap smears.

Patients from the pre-literate class are often uncomfortable discussing sexual relationships and reproductive health.

The rate of exclusively breastfeeding infants for the first 6 months is low. Other liquids are often introduced early on.
The Bhutanese tend to depend on herbal remedies and prefer to only take low doses of pharmaceutical drugs.

Traditional gender roles may influence utilization of health services. A woman will voice concern about the health of her spouse and children, but may be reluctant to discuss her own health.

Did You Know?
The Bhutanese view pregnancy, birth, and death as spiritually impure periods that require the performance of rituals.

Households are generally patriarchal. Women are expected to do almost all of the housework and have less authority in decision-making.

Hindus have important rituals and traditions at birth, marriage and at death. Families may prefer to forgo autopsy and organ donation.

Common health concerns
Bhutanese refugees have very high rates of anemia, chronic malnutrition, and micronutrient deficiency. Low meat consumption and long periods on refugee camp food rations may contribute to these high rates. Common micronutrient deficiencies include Vitamin B12, Vitamin A, and Vitamin B2.

Other health concerns include diarrhea, acute respiratory illness, malaria, intestinal parasites, and tuberculosis.

Mental health is a major concern for Bhutanese refugees. Many have spent long periods of time living in refugee camps and have experienced trauma due to detention, imprisonment, torture, sexual assault, rape, and domestic violence.

Bhutanese refugees exhibit high rates of depression, anxiety, and PTSD. There have also been a high number of suicides among Bhutanese refugees who have resettled in the US. This prompted a formal investigation and report by the CDC entitled “An Investigation into Suicides among Bhutanese Refugees in the US 2009 – 2012”.

Potential barriers to care
• Inability to obtain health insurance
• Inadequate interpreter services
• Unfamiliarity with modern amenities
• Poor understanding of health care system
• Traditional gender roles affecting health care utilization
• Transportation difficulty
• Limited health literacy
• Stresses of resettlement
• High cost of care

Arizona Department of Health Services • Community Profile
**Community Profile: Iraqi**

**Language:** Arabic, Kurdish, Chaldean  
**Country of Origin:** Iraq  
**Places of Transition:** Syria, Jordan, Lebanon, Turkey

*This guide is meant to provide a general cultural orientation and does not describe every person from this community*

---

**Dos and Don’ts**

- Respect the patient’s religious beliefs and practices.
- Whenever possible, match patients with caregivers of the same gender.
- Address the patient formally with Mr., Mrs., or Miss, rather than using first names.
- A handshake with eye contact and a smile is a common greeting, however men should wait for a woman to extend her hand first.
- If the husband is present in the room of a female patient, be sure to acknowledge his presence when speaking.
- Always explain your reason for initiating contact before touching the patient.
- Prioritize urgent concerns and if there are concerns that have not been addressed yet, be sure to schedule a follow-up visit.
- Smile, listen attentively, and express genuine concern.
- Compliment good health behavior to encourage and reinforce healthy habits.
- Inform the patient of proper medication usage, and describe the consequences of inappropriate use.
- Be sure to stress disclosure of all medications.

---

**Health attitudes, beliefs and stigmas**

The majority of Iraqis practice Islam (2/3 Shi’a, 1/3 Sunni). A small minority practice Christianity and other religions.

It is common for conservative Muslims to accept a health condition as God’s Will and reject treatment.

Iraqis may use natural remedies such as cumin, tea, butter, and henna to treat minor ailments.

Muslims follow halal dietary laws. Meat must come from animals slaughtered by another Muslim according to ritual. Pork and alcohol are forbidden.

During Ramadan, Muslims fast from sunrise to sunset for a month. Medication regimens may need to be adjusted.

Children, pregnant women, and the ill may be exempt from the fast. Still, conservative Muslims may refuse to take medication during the daytime. Speak with an elder in the family, or an Imam, to discuss if the patient’s state of fasting is inappropriate.

---

In Iraqi culture, there is a strong stigma associated with mental health and counseling services. Discuss mental health issues in terms of the symptoms, rather than using jargon that may elicit immediate negative reactions.

Many Iraqis have come from a modern city and an educated background, shaping their health beliefs. Take time to learn about the patient’s family situation and life in Iraq.

---

1. Shi’a and Sunni are two major denominations within the religion of Islam.  
2. Ramadan is a month of religious observance for Muslims. Based on a lunar calendar, the dates for Ramadan change from year to year.  
3. In Islam, an Imam is a religious leader or scholar.
Exercise is not emphasized in Iraqi culture as important for health. Being overweight is often associated with health and strength.

Iraqis are reluctant to discuss sexual relationships, and premarital sex is rare in youth. Avoid asking questions that may be seen as shameful or emotionally disturbing.

An Iraqi may voice a specific concern repeatedly. Repetition is used to show emphasis and the priority of a concern.

Iraqis often expect to receive medication for each visit to a provider. If no medication is necessary, be sure to explain why.

Did You Know?

1 in 5 Iraqi refugees has experienced torture or violence, and many more have witnessed such cruelty.

Unrelated community members may visit the patient or newborn as part of religious tradition.

Death is commonly accepted as having been predetermined by God. Families may wish to decrease sedation, discontinue life support, or forgo autopsy and organ donation for the patient.

Some people, accustomed to the Iraqi healthcare system, may be forceful and demanding in expressing their needs. Be patient and help them understand the US healthcare system.

Understand that there is diversity among Iraqis and there may be resistance to interact with others across socioeconomic, religious, gender or political lines.

Common health concerns

One in five Iraqi refugees has experienced torture or violence, and many more have witnessed such cruelty. Victims of torture and violence may have physical wounds, amputations, or traumatic brain injury (TBI).

Iraqi refugees exhibit very high rates of depression, anxiety, and PTSD. Many have experienced trauma associated with war, killings, kidnapping, rape, imprisonment, torture, blackmail, and threats from militias.

Iraqis experience high rates of chronic health conditions including obesity, hypertension, diabetes, arthritis and high cholesterol.

Other health concerns include low vaccination rates in children, high rates of latent tuberculosis, and high rates of congenital diseases and cancer linked to the effects of war.

Potential barriers to care

- Inadequate interpreter services
- Previous unfavorable healthcare experience
- Desire to maintain modesty and gender preferences in seeking and accepting care
- Values of family privacy and honor
- Transportation difficulty
- Domestic violence
- Limited health literacy
- Stress of resettlement
- Lack of follow-up care
- High cost of care

For additional resources, please visit Azrefugeehealth.org

Arizona Department of Health Services • Community Profile
Community Profile: Somali

Language: Somali, Arabic
Country of Origin: Somalia
Places of Transition: Djibouti, Kenya, Ethiopia, Burundi, Yemen

This guide is meant to provide a general cultural orientation and does not describe every person from this community.

Dos and Don’ts

- Recognize that the clan is an important social unit, and much of the conflict in Somalia is due to inter-clan disputes. However, avoid referring to clans because it is considered disrespectful.
- Respect the patient’s religious beliefs and practices.
- Whenever possible, match patients with caregivers of the same gender.
- A handshake is a common greeting, but only between people of the same sex.
- Be aware that Somalis may avoid eye contact as a sign of respect.
- Use the right hand to greet or give medication and food to the patient. The right hand is considered the clean and polite hand to use for daily tasks.
- Always explain your reason for initiating contact before touching the patient.
- Somalis may not express gratitude or appreciation verbally. Do not assume patients are ungrateful.
- Avoid excessive complimenting of patients that could be interpreted as casting the ‘evil eye’ upon them.
- Emphasize adherence to medication regimens and preventive medicine.

Health attitudes, beliefs and stigmas

Most Somalis practice Islam and the majority are Sunni Muslims.

Somalis may attribute health conditions to God’s Will, spirit possession, or the ‘evil eye’ — the belief that directing comments of praise at a person will cause misfortune or harm to befall the person.

Many Somalis believe illness is prevented through prayer and adherence to Islam, and are unfamiliar with the US model of preventive medicine.

A common traditional belief is that there is no need to continue taking medication if feeling healthy.

Common alternative medicine practices include herbal remedies, wearing amulets, and ‘fire-burning’, in which a special stick is burned and applied to the skin.

Muslims follow halal dietary laws. Meat must come from animals slaughtered by another Muslim according to ritual. Pork and alcohol are forbidden.

During Ramadan, Muslims fast from sunrise to sunset for a month. Medication regimens may need to be adjusted.

Children, pregnant women, and the ill may be exempt from the fast. Still, conservative Muslims may refuse to take medication during the daytime. Speak with an elder in the family, or an Imam, to discuss if the patient’s state of fasting is inappropriate.

In Somali culture, there is a strong stigma associated with mental health and counseling services.

Somalis often expect to receive medication for each visit to a provider. If no medication is necessary, be sure to explain why.

---

1. Shi’a and Sunni are two major denominations within the religion of Islam.
2. Ramadan is a month of religious observance for Muslims. Based on a lunar calendar, the dates for Ramadan change from year to year.
3. In Islam, an Imam is a religious leader or scholar.
Circumcision for both males and females is considered an important rite of passage, necessary for marriage, and a source of pride, as the uncircumcised are considered unclean. Due to the practice being illegal in the US for females under 18, Somali families are often reluctant to discuss this issue or may wish to transport the child to another country to perform the procedure.

**What you may see**

Family and honor are very important in Somali culture. The health of one family member is of concern to the entire family.

If a patient is found to be terminally ill, the family may wish for the health care provider to tell the family members first, so they can comfort and protect the patient.

Somali society and households tend to be male-centered. A male family member usually serves as the family spokesperson and decision-maker. Rural women may be shy and reluctant to speak up in the presence of men.

Somalis tend to have large families. One-fifth of the population is polygamous.

Women marry and have children early. It is not uncommon for a woman to have 7 or 8 children. Children are highly valued and elders are highly respected.

Before coming into the US, about 80% of Somalis lived a nomadic or semi-nomadic lifestyle as herders.

Somalis have three names: given name, followed by father’s and grandfather’s given names. Somalis usually identify with their first and second names or a nickname. Women do not change their names at marriage.

Muslim women may wear a hijab (head covering) or jilbab (full body covering) for modesty.

**Did You Know?**

By age 10, about 98% of Somali girls undergo some form of circumcision.

The literacy rate among Somalis is low since the written form was only created in 1972, and ongoing civil war has disrupted the education system.

Many males chew qat, a leafy narcotic. Qat is an illegal drug in the US and may have health implications.

Somalis greatly appreciate oral communication and have a tradition of using proverbs in everyday speech.

**Common health concerns**

An estimated 30% of Somali refugees have been tortured, and many have experienced trauma associated with war, rape, mass violence, severe poverty, famine, and living in refugee camps for a long period.

Somali refugees have high mental health needs, exhibiting high rates of depression, anxiety, PTSD, psychosomatic symptoms, flashbacks, misplaced anger, and feelings of disconnection.

Malnutrition is common among Somalis. Common concerns include iron deficiency, anemia, Vitamin A deficiency, and scurvy.

Common infectious diseases include diarrheal disease, measles, malaria, and acute respiratory illness. Intestinal parasites affect 47% of arriving Somali refugees.

Female circumcision causes many health complications including urinary tract infections, menstrual problems, chronic pain, and increased risks during pregnancy.

**Potential barriers to care**

- Inadequate interpreter services
- Previous unfavorable healthcare experience
- Desire to maintain modesty and gender preferences in seeking and accepting care
- Male-centered household and health decisions
- Traditional beliefs may interfere with treatment
- Low adherence to preventive medicine
- Values of family privacy and honor
- Transportation difficulty
- Stresses of resettlement
- Limited health literacy
- High cost of care
